

VegPro scouting platform — setup on FDB

For: Imran (IT) and VegPro team

From: Kalpit Patel

The production app uses **only Microsoft SQL Server** on FDB (`Scouting` database). **No Supabase** and **no PostgreSQL**.

Stack on FDB

Piece	Technology
Website	Next.js on IIS + HTTPS + Node.js
Database	MS SQL — database Scouting on 192.168.16.14
Photos	Folder on FDB disk (data/evidence or EVIDENCE_STORAGE_PATH)
Logins	Email/password in <code>dbo.users</code>

Before you start

- ☐ SQL login with rights on **Scouting** (Imran provided)
- ☐ **Node.js 20 LTS** on FDB
- ☐ **HTTPS** for scouts' phones (GPS requires TLS)
- ☐ VPN for Kalpit to run scripts during setup

Step 1 — Database scripts (SSMS → Scouting)

Run in order:

1. `sql/mssql/001_schema.sql`
2. `sql/mssql/002_seed_bemack_core.sql`
3. `sql/mssql/003_activities.sql` (if using activities / QR)

Then from a dev PC on VPN:

```
npm run seed:mssql-users
```

Step 2 — App configuration (.env.local on FDB)

```
DATA_BACKEND=mssql
NEXT_PUBLIC_DATA_BACKEND=mssql

MSSQL_SERVER=192.168.16.14
MSSQL_DATABASE=Scouting
MSSQL_USER=
MSSQL_PASSWORD=
MSSQL_TRUST_SERVER_CERTIFICATE=true

SESSION_SECRET=long-random-secret

# Optional – photo storage on FDB disk
# EVIDENCE_STORAGE_PATH=D:\Apps\vegpro-scouting\data\evidence
```

Do **not** set Supabase URL/keys on VegPro production.

Step 3 — Deploy website

```
npm ci
npm run build
npm run start
```

Use **IIS reverse proxy** to port `3000` with HTTPS (see prior FDB IIS notes).

Step 4 — Smoke test

#	Test
1	Login worker@vegpro.com / VegPro2026!
2	Start scouting walk, save a stop
3	Manager sees stop on Scouting dashboard
4	Report infestation + log spray
5	Admin creates a new worker account
