

VegPro Smart Farm — Demo Presenter Script

Audience: VegPro Kenya Ltd (Bemack scouting & GPS focus)

Duration: 15–20 minutes (live walkthrough)

App: VegPro Smart Farm — <http://localhost:3000> (or deployed URL)

Demo readiness — your four focus areas

VegPro focus	Ready?	Where in the app	Notes
How scouts enter data	Yes	Worker → Field work → Scout stop / infestation / spray	Bemack master lists from your scouting spreadsheet (categories, varieties, pests, diseases, 15 parameters)
How GPS captures data	Yes	Live GPS tracking card on Field work	Browser geolocation every 15s; coordinates saved on each stop; worker position synced to backend
GPS → farms & greenhouses	Yes	Current assignment banner; manager Scouting route map; Farm map	17 Bemack greenhouse anchors (BEGH 01–17); nearest-greenhouse assignment from live coords
Data captured	Yes	Manager Scouting records table; Dashboard KPI; heat grid	Each stop stores farm, GH, column/bay, issue, rating, lat/lng, optional parameter observations

Verdict: The demo is **ready** for your stated focus. Run the pre-demo checklist below so manager screens are populated and live saves work during the meeting.

Pre-demo checklist (30 minutes before)

Option A — Live Supabase (recommended for realtime)

1. Apply Supabase migrations 006 through 012 and run `supabase/link-auth-users.sql`.
2. Create Auth users: `worker@vegpro.com` and `admin@vegpro.com` (passwords you control). Update UUIDs in `link-auth-users.sql` if they differ.
3. Run `supabase/migrations/012_sample_bemack_demo.sql` — pre-fills scout routes, heat grid, and farm map pins.
4. Confirm `.env.local` has `NEXT_PUBLIC_SUPABASE_URL` and `NEXT_PUBLIC_SUPABASE_ANON_KEY`.
5. Start the app: `npm run dev` (port 3000).
6. **Two screens:** Manager on laptop (projector); worker on phone/tablet or second browser window.
7. On the worker device: allow browser location **or** plan to use **Override greenhouse** (see GPS notes).

Option B — Offline / no Supabase

- Cookie login works; field data saves to browser storage and appears on manager scouting views.
- Say: *“Today we can show the full flow locally; production connects to your Supabase project for multi-device realtime.”**

GPS presenter tip (Windows laptops)

Browser “location allowed” is not always enough on desktop. If live coords fail:

- Enable **Windows** → **Settings** → **Privacy & security** → **Location**, or
- Use **Override greenhouse** on the worker Field work page (still demonstrates farm/GH assignment and saved coordinates).

Accounts & navigation

Role	Login	After login
Scout / worker	worker@vegpro.com	Field work (/worker/field)
Manager	admin@vegpro.com	Dashboard → Scouting → Farm map

Opening (1 minute) — what to say

*“Thank you for your time. Today we’ll walk through how VegPro Smart Farm supports **Bemack precision scouting** — the same priorities you outlined: **how scouts enter data in the field, how GPS captures and assigns location, how that maps to your farms and greenhouses, and exactly what data is stored** for managers.*

>

*We’ll use the **Bemack** farm with your **17 greenhouses (BEGH 01–17)** and master lists derived from your scouting spreadsheet. You’ll see a scout on a phone and the manager view update in near real time.”*

Part 1 — How scouts enter data (5 minutes)

Screen: Worker login → **Field work**

1a. Set context — data flow panel (30 sec)

Point to the blue **“Demo: how to capture field data”** panel.

"The field app is designed for scouts walking the crop. Step one is GPS assignment; step two is structured data entry aligned with how you scout today — category, variety, column, bay, pests and diseases — not free text in a notebook."

1b. Live GPS → greenhouse assignment (1 min)

Scroll to **Live GPS tracking**.

*"When the scout opens Field work, the device reads GPS every **15 seconds**. We don't ask them to pick a greenhouse manually in normal use — the system finds the **nearest Bemack greenhouse anchor** and sets **Current assignment**, for example **Bemack / BEGH 16**."*

>

*You can see coordinates here and distance to the greenhouse anchor. If GPS isn't available on a demo laptop, we use **Override greenhouse** — in the field, scouts rely on live GPS on their phones."*

Action: Allow location or select **BEGH 16** (or any GH) in Override. Confirm **Current assignment** appears.

1c. Scout route round (1 min)

Point to **Scout route (Scarab-style)**.

*"Before recording stops, the scout **starts a round** — similar to a Scarab scouting session. Each stop they save is linked to that round with a timestamp and GPS. When they **complete the round**, the route is locked for reporting."*

Action: Click **Start round**.

1d. Scout stop form — core data entry (2 min)

Click **Scout stop (Bemack)**.

*"This is the main scouting capture screen, built from your **Bemack Scouting Data** lists:*

>

- **Category** — Super Premium or Alstroemeria
- **Variety** — your full variety list per category
- **Beds, column, bay** — exact location inside the greenhouse

- **Issue type** — pest or disease, then the specific issue from your lists
- **Rating** — severity 1–5
- **15 scouting parameters** — optional toggles with ratings (white flies, thrips, botrytis, crop vigor, etc.)
- **Notes** — free text when needed

>

The farm and greenhouse at the top come from GPS — the scout doesn't re-type Bemack or BEGH numbers."

Action: Fill a realistic example, e.g. Super Premium → ANNAKARINA → Column 2, Bay 8 → Pest → Thrips → Rating 4 → tick **Thrips** under parameters → **Save**.

"On save, we capture GPS again at the moment of the observation, so each stop has its own latitude and longitude — not just the greenhouse default."

Part 2 — How GPS captures data (3 minutes)

Stay on worker Field work, then briefly mention other capture paths.

What to say

*"GPS works at **three levels** in the system:*

>

1. **Continuous tracking** — every 15 seconds while Field work is open; updates **Current assignment** and, when connected, the manager **Farm map** worker dot.
2. **Stop-level capture** — when the scout hits Save, we store precise coordinates on that scouting record.
3. **Same GPS context** for **Quick infestation report** and **Log spray** — one location model for all field actions.

>

Coordinates are stored as decimal latitude/longitude. On desktop demos without a GPS fix, we fall back to the selected greenhouse anchor so you still see the full manager workflow."

Optional action: Click **Refresh GPS now** and point at the coordinate line and distance in metres.

Part 3 — GPS → farms & greenhouses (4 minutes)

Switch to manager screen: admin@vegpro.com

3a. Dashboard (30 sec)

*"Managers land on the dashboard. **Scouting stops today** reflects field activity. Alerts and the live feed show new stops as scouts save them."*

3b. Precision scouting — heat grid & route map (2 min)

Open **Scouting** (/manager/scouting).

Point to **Greenhouse heat grid**:

*"Pressure rolls up by **greenhouse** — which BEGH units need attention based on recent stop ratings and issues."*

Point to **Scout route map**:

*"This is the GPS story for managers. Each saved stop is a point on the map — greenhouse, column, bay, issue, time. Select a **scouting round** to see the path the scout walked. Seed data from BEGH 01 and BEGH 05 illustrates a multi-greenhouse route."*

Action: Select the demo round from the dropdown; zoom/pan the map.

3c. Farm map (1 min)

Open **Farm map** (/manager/map).

*"The **farm map** ties operational data to geography: **infestation hotspots** from scout reports, spray activity, and **live worker GPS**. Everything is anchored to **Bemack** and the correct greenhouse — so GPS isn't abstract; it drives which GH appears in tables, heat maps, and alerts."*

3d. Live proof (30 sec)

If Supabase is live: save **one more stop** on the worker device.

“Watch the scouting table and route map — the new stop should appear within seconds without refresh.”

Part 4 — Data captured (3 minutes)

Screen: Manager **Scouting** → scroll to **Recent scouting stops**

What to say

“Every scouting stop persists structured data your agronomy and IPM teams can report on. Here’s what we store per stop:”

Field	Example	Purpose
Date & time	Today 10:42	When the observation was recorded
Scout	Worker name	Accountability
Farm	Bemack	Farm context
Greenhouse	BEGH 16	GH from GPS assignment
Category	Super Premium	Crop program
Variety	ANNAKARINA	Variety-level pressure
Beds / Column / Bay	20 / 2 / 8	In-greenhouse location
Issue type & name	Pest · Thrips	IPM targeting
Rating	1–5	Severity / pressure
GPS	-1.29210, 36.82190	Route map & audit trail
Parameter observations	Thrips present, rating 4	Multi-parameter scouting
Round ID	Linked session	Scarab-style route & timing
Notes	Optional text	Scout comments

“We also capture **infestation hotspots** (pest type, problem description, severity, GPS) and **spray logs** (product, greenhouse, time) through the same Field work hub — so scouting, escalation, and treatment sit in one platform.”

Closing (1 minute) — what to say

*“To summarise for VegPro: scouts enter data through a **mobile Field work** flow aligned with your **Bemack lists**; **GPS assigns the greenhouse automatically** and records coordinates on every stop; managers see that on **heat grids, scout routes, the farm map, and exportable records**; and we capture the full scouting payload — location, crop, pest/disease, ratings, and parameters — ready for your spray program and reporting.*

>

Next steps we’d suggest: connect this to your production Supabase project, onboard scout accounts, and optionally align greenhouse anchor coordinates with your survey GPS if you have sub-metre GH corners.”

Quick reference — demo flow (cheat sheet)

Step	Who	Do	Say (one line)
1	Worker	Open Field work	“Scout’s daily screen.”
2	Worker	GPS / Override GH	“Nearest Bemack GH assigned automatically.”
3	Worker	Start round	“Scarab-style session starts.”
4	Worker	Scout stop → Save	“Structured Bemack data + GPS on save.”
5	Manager	Dashboard	“Stops today KPI.”
6	Manager	Scouting → route map	“GPS path and stops by GH.”
7	Manager	Farm map	“Hotspots + live worker position.”
8	Manager	Records table	“Full data captured per stop.”

Likely questions & suggested answers

Q: Do scouts scan QR codes?

A: GPS-first assignment to the nearest greenhouse. QR scanning is available for other activity flows; Bemack scouting demo uses GPS geofencing to match how scouts move between houses.

Q: Can this work offline?

A: The demo supports offline/local storage. Production uses Supabase with sync when connectivity returns.

Q: How accurate is greenhouse assignment?

A: We use haversine distance to the nearest of 17 anchored GH positions. For production, anchors can be set to your surveyed GH coordinates.

Q: Does this replace Scarab?

A: It mirrors Scarab-style **rounds, routes, and stop timing** while integrating infestation, spray, and manager dashboards in one VegPro platform.

Q: What about other farms besides Bemack?

A: The data model is multi-farm; this demo is seeded for Bemack per your spreadsheet and SOW scope.

Troubleshooting during the demo

Problem	Fix
"Worker profile missing" on save	Run <code>link-auth-users.sql</code> after creating Auth user
"Master data missing"	Run migrations <code>006-007</code>
Empty manager scouting views	Run <code>012_sample_bemack_demo.sql</code> or save a live stop
GPS stuck on worker laptop	Use Override greenhouse ; explain field phones use real GPS
Manager doesn't update live	Check Supabase env vars and Realtime migrations <code>004, 008, 010</code>
